

# Google Custom Search API Python Tutorial

September 28, 2019 by [Gulsanober Saba](#) [Leave a Comment](#)

Many applications need a Google Custom Search engine to perform web scraping. In this case, you need to implement a Google Custom Search option in your application. So in Google Custom Search API Python Tutorial, you will learn to implement Google Custom Search in your Python application. So let's get started without any delay.

As we all know that Google Search engine is the most popular search engine. It is running in the world's largest web index. So if you search anything on Google Search, then you get thousands of results in the order of their relevancy. So before moving to our main topic of this tutorial, we will need to understand some basic knowledge of Google Custom Search and why any application needs it. So let's see it.

# Google Custom Search API Python – Understanding The Basics Of Google Custom Search

## What Is Google Custom Search ?

- Google Custom Search enables you to create a search engine for your website, your blog, or a collection of websites.
- You can configure your engine to search both web pages and images.
- Google custom search searches across a specified collection of sites or pages
- The main feature of google custom search is that you can get a **Tropical search engine** that means you can restrict search result to a particular website or a set of some particular websites.

## Use Cases Of Google Custom Search

There are two main use cases for Custom Search –

- you can create a search engine that searches only the contents of one website (site search).
- you can create a search engine that focuses on a particular topic from multiple sites.

## Why Google Custom Search ?

Although there is many web scraping techniques available, so you might think **why we need google custom search**. So the answer is following –

So consider a scenario where you want to use search results in some of your projects. Then how can you fetch search results using your code. It is obvious that you will do web scraping, you will send a request to that particular url and then you will get html code and then you can scrap the useful informations from it by using any programming language. Now the issue is that sometime web scraping gets in trouble and not encouraged by google and you might even be thought as a bot and get blocked by the google search engine. And that's why google custom search is applied in that scenarios.

## Google Custom Search API Python – Getting Started

Now we will see how can we implement google custom search using python.

### Custom Search Engine JSON API

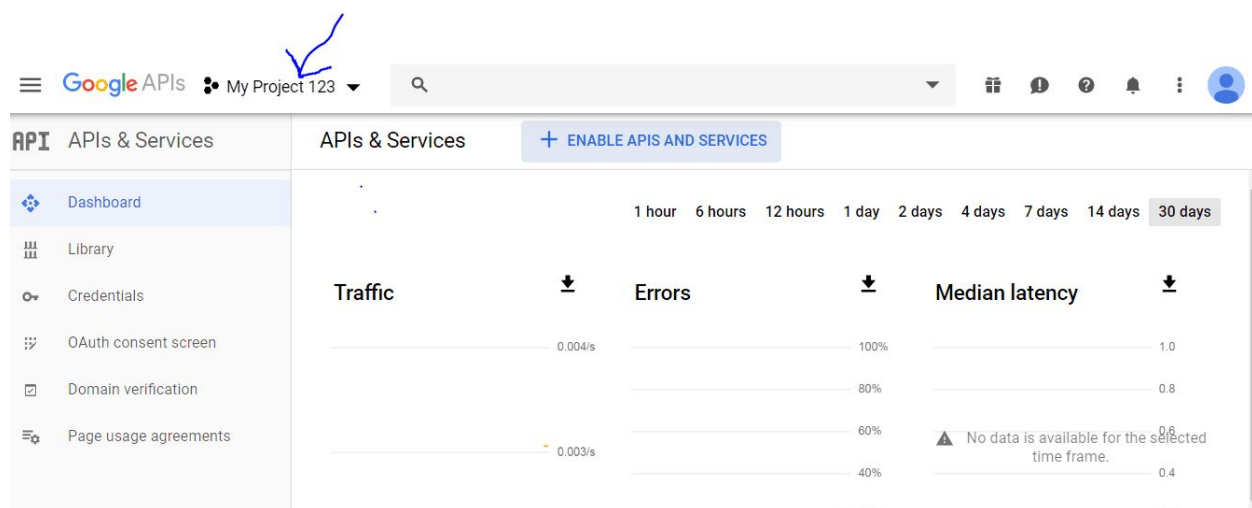

The Custom Search JSON API lets you develop websites and applications to retrieve and display search results from Google Custom Search programmatically. With this API, you can use RESTful requests to get either **web search** or **image search** results in JSON format.

Custom Search JSON API can return results in [JSON](#) data format.

### Create a project on Google Developers Console

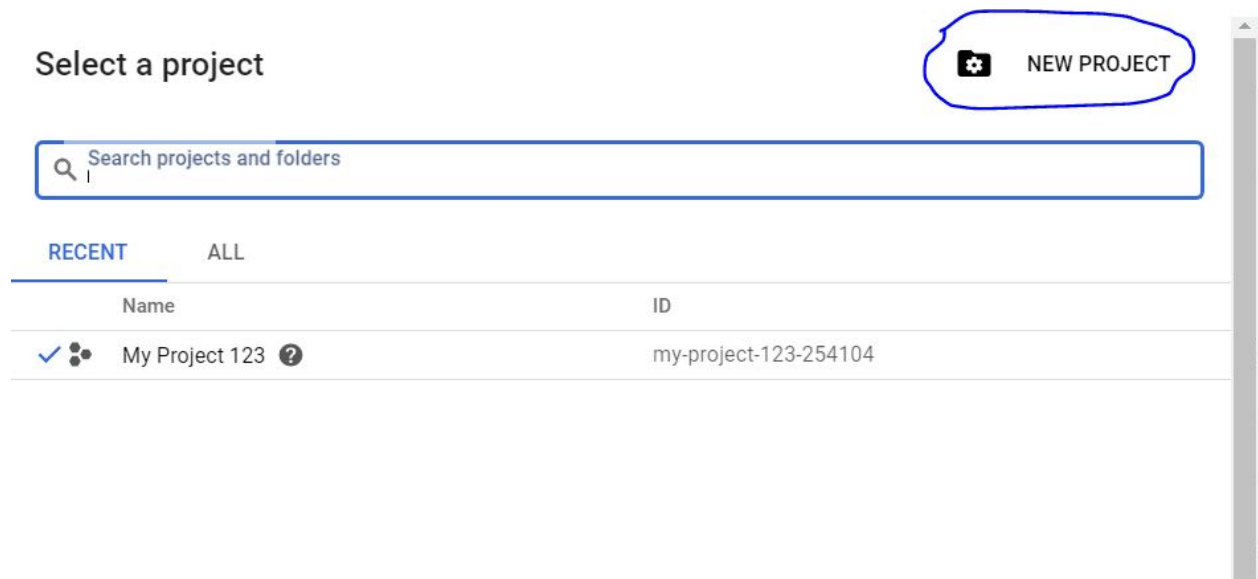

The first thing that you have to do is to create a project on [google developers console](#).

You will get something like this –

### Google Custom Search API Python

Now click on Select Project and below screen will be open.

### Google Custom Search API Python

- Now if you want to use your existing project then click on **Search projects and folders** otherwise to create new project click on **NEW PROJECT** option.
- Now enter your project name and click on create button.

## New Project

You have 11 projects remaining in your quota. Request an increase or delete projects. [Learn more](#)

[MANAGE QUOTAS](#)

Project name \*

My Project 111

Project ID: my-project-111-254117. It cannot be changed later. [EDIT](#)

Location \*

No organization

[BROWSE](#)

Parent organization or folder

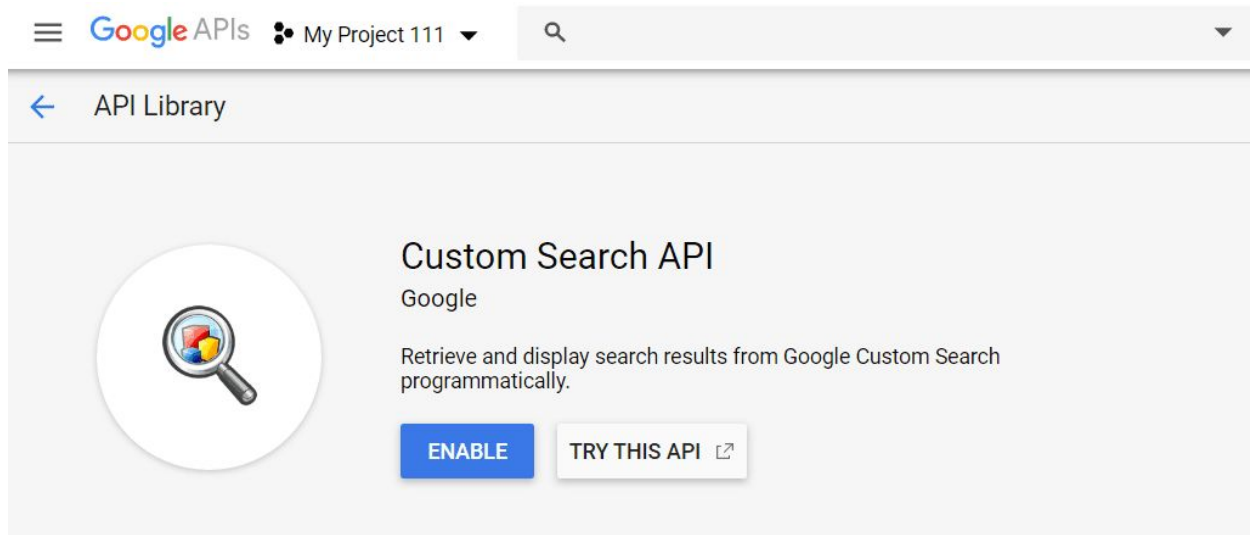

[CREATE](#)

[CANCEL](#)

## Google Custom Search API Python

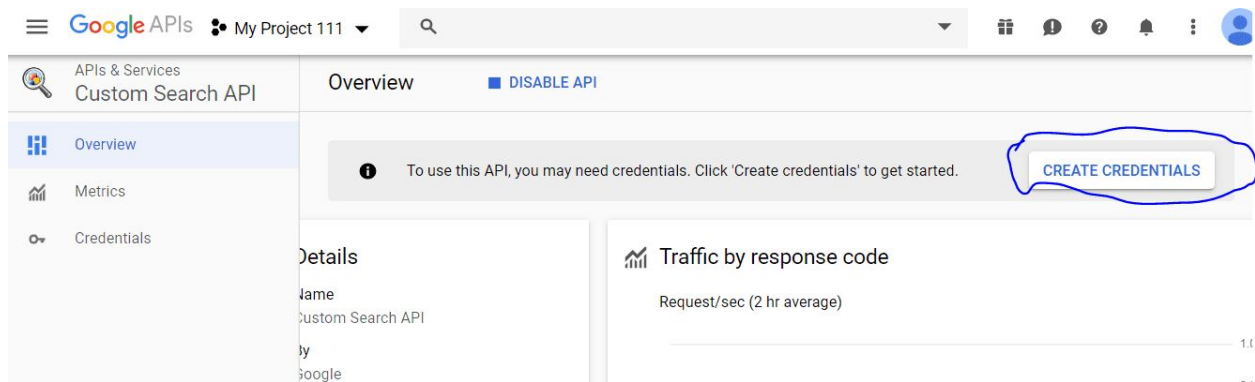

### Enable Custom Search API and generate API key

Now you have to enable custom search API. So to enable this, type custom search API on search bar, and then click on **ENABLE** button of the following page. And now your current project is able to interact with this particular API.

### Google Custom Search API Python

Now the next thing you have to do is to go to credentials and in credentials part you have to create some credentials using which you can call google custom search API. Just click on create credentials option.

### Google Custom Search API Python

- Now you will get following screen.

## Credentials

### Add credentials to your project

#### 1 Find out what kind of credentials you need

We'll help you set up the correct credentials

If you wish you can skip this step and create an **API key**, **client ID**, or **service account**

##### Which API are you using?

Different APIs use different auth platforms and some credentials can be restricted to only call certain APIs.

Custom Search API

##### Where will you be calling the API from?

Credentials can be restricted using details of the context from which they're called. Some credentials are unsafe to use in certain contexts.

Choose...

##### What data will you be accessing?

- Now in which API are you using option you have to select Custom Search API option.
- And now click on API key and now you will get this screen.

## API key

pass it with the `key=API_KEY` parameter.

## Name

## Key restrictions

This key is unrestricted. To prevent unauthorized use and quota theft, restrict your key. [Learn more](#)

Application restrictions: None

API restrictions: None

Application restrictions

API restrictions

API restrictions specify which APIs can be called with this key.

No API restrictions. This key can access all APIs enabled in this project.

## API restrictions

Note: It may take up to 5 minutes for settings to take effect

Create

Cancel

- In API Restrictions you have to select Custom Search API option and click on create button. Now you will get your API key.

## API key created

Use this key in your application by passing it with the `key=API_KEY` parameter.

Your API key

AIzaSyC1dd2iAVYFuhkyKSrE-nB9Q\_rTrWKoWHA

Restrict your key to prevent unauthorized use in production.

[CLOSE](#)

[RESTRICT KEY](#)

## Create A search Engine

Now next thing you have to do is to create a search engine. So go to this [link](#) and create a search engine.

OFF

So we have created API key and custom search engine successfully. Now we will see how to perform search using python code.

## Python Program for Google Custom Search

In this section, we will see how can we get search results using python code so let's do it.

### Installing Module

The first thing you have to do is to install **google-api-python-client** module. To install this run the following command on your command prompt.

```
pip install google-api-python-client
```

### Python Code For Google Custom Search

Now write the following code on your python IDE(check [best python IDEs](#)).

```
from googleapiclient.discovery import build
import pprint

#define key
api_key = "Your API Key"
cse_key = "Your Custom search Engine Key"

resource = build("customsearch", 'v1',
developerKey=api_key).cse()
result = resource.list(q='simplified python',
cx=cse_key).execute()

pprint.pprint(result)
```

### What we Did?

- First of all import build method from googleapiclient module and import [pprint](#) module.
- Then enter API key and CSE key.
- Now create a resource object through which you can send the request.
- To create a resource object, you have to call build() function. And the **first parameter** will be **service** that is “**customsearch**”. The **second parameter** will be the **version** that is “**V1**”. And the **last parameter** will be **developer key** that is **api\_key**. This will build a simple resource for you.
- In order to create custom search resource object, you have to call **cse()** method.
- Now you have to call the list() function that will return you search results.
- list() function takes two parameter. The first one **q** that is **query string** and the second one is **cx** that is **custom search engine ID**. This will just create a request for you, it is not actually executing the request. So to execute the request, you have to call the execute() method.
- Finally print the result. Here i am using pprint because search result's data is JSON data and JSON data is not formatted so it's hard to read and that's why we need the pretty printed.

- Now run the code and check the result. So the search result is as below.

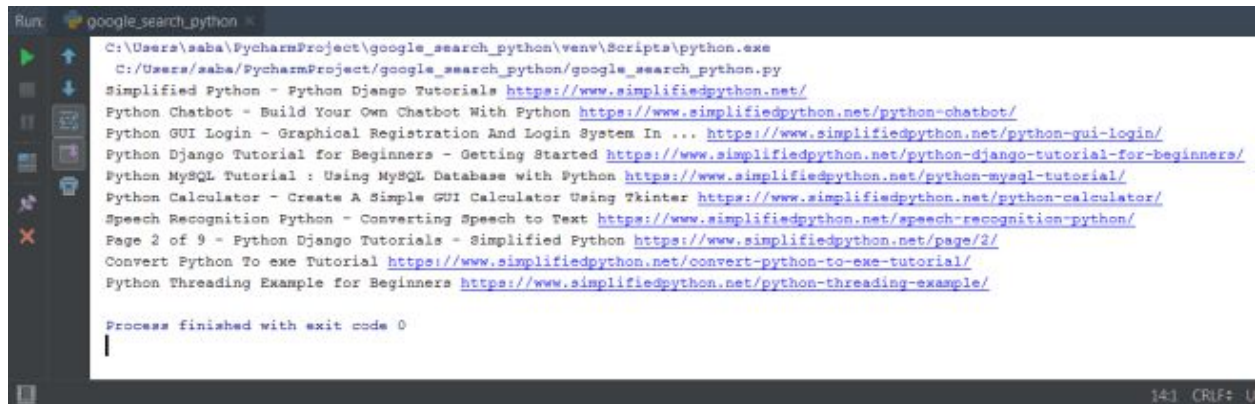

```
Run: google_search_python x
C:\Users\saba\PycharmProject\google_search_python\venv\Scripts\python.exe
C:/Users/saba/PycharmProject/google_search_python/google_search_python.py
{'context': {'title': 'my first custom search'},
 'items': [{'cacheId': 'z0Ouy_G98fMJ',
            'displayLink': 'www.simplifiedpython.net',
            'formattedUrl': 'https://www.simplifiedpython.net/',
            'htmlFormattedUrl': 'https://www.<b>simplifiedpython</b>.net/',
            'htmlSnippet': 'Filed Under: Data Science Tagged With: libraries '
                           'used in data science, most <br>\n'
                           'useful <b>python</b> libraries for data analysis, '
                           '<b>python</b> frameworks for data science&nbsp;...',
            'htmlTitle': '<b>Simplified Python</b> - Python Django Tutorials',
            'kind': 'customsearch#result',
            'link': 'https://www.simplifiedpython.net/',
            'pagemap': {'creativework': [{'datepublished': '2019-09-24T04:20:37+00:00',
                                           'headline': 'Top 5 Python Libraries '
                                                         'For Data Science To '
                                                         'Learn In 2019',
                                           'image': 'https://i0.wp.com/www.simplifiedpython'
                                                         '.net/wp-content/uploads/2019/09/Python-Libraries-For-Data-Science-4.png?fit=300%2C162&ssl=1',
                                           'text': 'Data science is a most '}]}]}
```

You can see in output, results have only fetched from simplified python page not any other page.

Now if you want to get all the results that are fetched then write this code snippets.

```
for item in result['items']:
    print(item['title'], item['link'])
```

Now see the result, only title and link has been fetched.

```
Run: google_search_python x
C:\Users\saba\PycharmProject\google_search_python\venv\Scripts\python.exe
C:\Users\saba\PycharmProject\google_search_python\google_search_python.py

Process finished with exit code 0
```

You can also check the length of item in one API call by running this code.

```
print(len(result))
```

## How To Get Image Results Using Google Custom Search

Now we will learn how to get image results using google custom search. To do this you have to add only one thing in above code.

```
from googleapiclient.discovery import build
import pprint
api_key = "Your API key"
cs_key = "Your cse key"

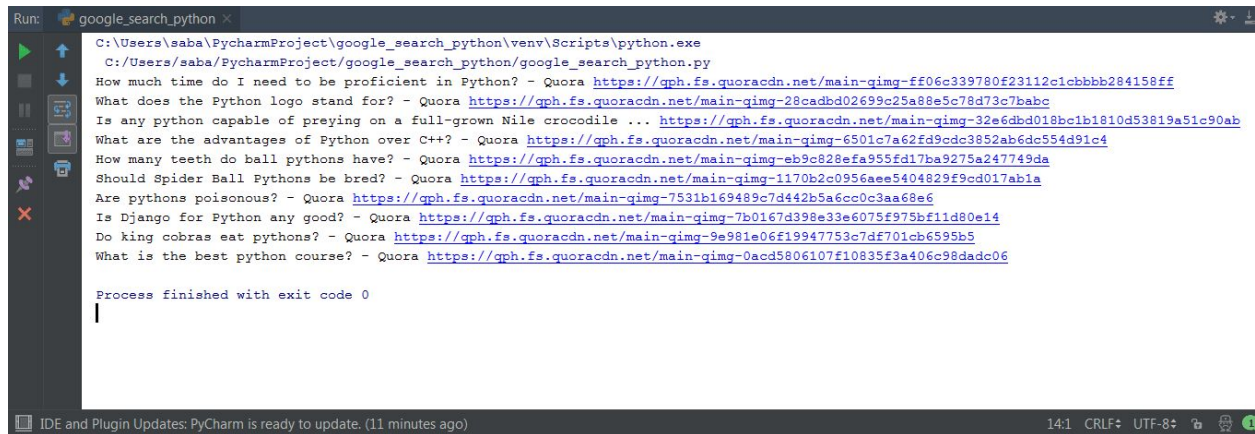

resource = build("customsearch", 'v1',
developerKey=api_key).cse()

result = resource.list(q='python', cx=cs_key,
searchType='image').execute()

for item in result['items']:
    print(item['title'], item['link'])
    • You have to include only searchType as image, and left are as usual.
```

So let's check the result.

```
Run: google_search_python
C:\Users\saba\PycharmProject\google_search_python\venv\Scripts\python.exe
C:\Users\saba\PycharmProject\google_search_python\google_search_python.py
